

HOSPITAL WIRING DEVICES

Mobile X-Ray

Power-Lock® Devices

A complete line of 50A and 60A locking plugs and receptacles to meet hospital non-interchangeability standards.

These devices are designed specifically to prevent the accidental insertion of non-x-ray equipment into an x-ray-only power source, and to make sure that x-ray equipment can only be inserted into x-ray receptacles. For added safety, they feature Cooper's Power-Lock® design, which only allows contact to be made after locking is complete, preventing air-gap sparking with its unique arc-snuffing capability—desirable in sensitive hospital environments.

Cooper mobile x-ray devices meet all hospital standards for non-interchangeability with regular wiring devices, and are only interchangeable with other x-ray devices of the same rating.
