

Straight Blade Receptacles

This hospital grade line defines durability—from our tamper resistant duplex receptacles to the most rugged decorator devices in the industry.

Sometimes the smallest innovations make the biggest difference. Consider the insulating Screw Terminal Guards™ on Cooper's line of hospital grade straight blade receptacles. Simply snap them up and out of the way to wire the terminals, then snap them down to put a solid insulating barrier between the terminals and surrounding contact surfaces. In less than a second you've helped to prevent short circuits without having to strap the device with tape. These guards not only make installation faster and safer, they do a better job, too.

Look inside our receptacles and you'll find a host of other reliability- and performance-enhancing features, such as five-leaf, solid brass line contacts that provide excellent plug retention. Long, broad, solid brass mounting straps easily accommodate large panel cutouts, and an automatic grounding system provides redundant grounding backup. All duplex contacts, terminal screws, and mounting screws and straps are nickel plated for excellent corrosion resistance, and we manufacture each base from rigid, unbreakable fiberglass-filled nylon for structural strength and superior heat resistance. With more designs and more features, we offer the industry's broadest, most versatile line of hospital grade receptacles.
